

Dictionary Data Type in Python

Dictionary in Python is an unordered collection of data, used to store data values pair of keys and value.

In Python, a Dictionary can be created by placing sequence of elements within curly `{}` braces, separated by 'comma'.

Dictionary can also be created by the built-in function `dict()`. An empty dictionary can be created by just placing to curly braces `{}`.

Note – Dictionary keys are case sensitive, same name but different cases of Key will be treated distinctly.

Method	Description
<code>clear()</code>	Remove all items form the dictionary.
<code>copy()</code>	Return a shallow copy of the dictionary.
<code>fromkeys(seq[, v])</code>	Return a new dictionary with keys from seq and value equal to v(defaults to None).
<code>get(key[,d])</code>	Return the value of key. If key doesnot exit, return d (defaults to None).
<code>items()</code>	Return a new view of the dictionary's items (key, value).
<code>keys()</code>	Return a new view of the dictionary's keys.
<code>pop(key[,d])</code>	Remove the item with key and return its value or d if key is not found. If d is not provided and key is not found, raises <code>KeyError</code> .
<code>popitem()</code>	Remove and return an arbitrary item (key, value). Raises <code>KeyError</code> if the dictionary is empty.
<code>setdefault(key[,d])</code>	If key is in the dictionary, return its value. If not, insert key with a value of d and return d (defaults to None).
<code>update([other])</code>	Update the dictionary with the key/value pairs from other, overwriting existing keys.
<code>values()</code>	Return a new view of the dictionary's values
